

PARKING MONITORING BY INTERMAPS AND SWARM ANALYTICS

A SWARM PERCEPTION BOX INSTALLATION

The Situation

Tourist regions in particular are highly frequented areas. With many, sometimes only temporary, parking facilities around bathing possibilities, excursion destinations and skiing regions, parking management is often a challenging task.

Solution & Results

- visual presentation of the current parking space distribution and utilization in real time
- Guest information as well as guidance by means of data interfaces
- responsive web based infoscreens with easy integration possibilities
- dashboard for management and reporting, providing at-a-glance information on occupancy, frequency and length of stay, as well as historical analysis
- Possibility of license plate recognition (ANPR) for accurate recording of parking times due to possible maximum parking durations
- the intelligent and camera-based vehicle recognition is data protection compliant (DSGVO/GDPR), as all image data is processed locally and also transmitted purely event-based in text form - without storing any personal data

Would you like to extract usable information in real time? We are happy to show you how! Simply send us an email or call us. We are looking forward to hearing from you!
